This GSS is part of an andom genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum. Saccharomyces exigatus, Saccharomyces rouxii. Sygoaaccharomyces rouxii. Saccharomyces rouxii. Saccharomyces kluyveri. Kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.

'Normalization and subtraction: two approaches to facilitate gene discovery', Genome Research 6:791-806, 1996. The first strand synthesis used a NotI-dT18 primer; double stranded cDNAs were ligated to ECORI adapters, digested with NotI, and directionally cloned into the NotI and ECORI-digested pT7T3-Pac vector. The library contained approximately 7.2 % 10°5 recombinants, with average insert sizes of 1-1.5 kb."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /notes: Vector: pT7T3-Pac; Site 1: EcoRI; Site 2: NotI; PolyA-selected mRNA was prepared from unfertilized Xenopus PolyA-selected mRNA was prepared from unfertilized Xenopus laevis eggs. The library was constructed in the vector pT7T3-Pac as described in Bonaldo, M.F., Lennon, G. and Soares, M.B. 'Normalization and subtraction: two approaches to facilitate gene discovery', Genome Research 6.791-806, 1996. The first strand synthesis used a NotI-dT18 primer, double stranded cDNAs were ligated to EcoRI adapters, digested with NotI, and directionally cloned into the NotI and EcoRI-digested pT7T3-Pac vector. The library contained approximately 7.2 X 10.5 recombinants, with average insert sizes of 1-1.5 kb."

This sequence represents a human fibronectin fragment, containing fibrin binding domains. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (FG) activation, and fibrin binding regions of human fibronectin, which are from fibrin binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically retains a FG activation ability which becomes evident only after a pronounced duration, or lag, after stroptokinase-fibrin binding domain polypeptides are useful in

                       hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen to plasmin, thus aiding in the localisation of the plasminogen activation process to the site of pathological thrombus. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

Host cells containing a replicable vector comprising the MSF encoding nucleic acid can be used for the recombinant production of the protein. The polypeptide can be used for modulating cell migration, healing a wound and for preventing scarring. The present sequence represents the human fibronectin
thrombolytic therapy for various kinds of cardiovascular disorders. The

                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                         Human fibronectin (AAR92778) has a fibrin-binding site, close to the C-terminus (amino acids 2123-2232 or 2141-2230), covering the 10F1.11F1 module pair of the protein. Fibrin-binding sites can be prepd. by enzymatic cleavage of fibronectin, peptide synthesis or by recombinant DNA techniques. They are used to detect a fibrin-binding target site, to treat disorders involving abnormal fibrinolysis or fibrinogenesis, to disrupt blood clots and to aid delivery of medicaments to fibrin- contg. sites. They show high affinity to and slow dissociation from fibrin, and provide fast diffusion and rapid clearance

The invention relates to obtaining a population of quiescent haematopoietic cells (HC), comprising culturing HC while adhering the cells to a polypeptide having a very late antigen-4 (VLA-4) binding site, in particular fibronectin polypeptide, so as to expand the number of HC, where the adhering provides an increased percentage of quiescent HC. Also included are inducing apoptosis of a subpopulation of HC, by contacting the cells with a polypeptide having a VLA-4 binding site under conditions to cause apoptosis of a subpopulation of HC and a medium for culturing HC which enriches quiescent HC, comprising a fibronectin polypeptide. The method is useful for obtaining a cell population containing quiescent haematopoietic cells which are useful for treating a subject. Use of the VLA-4 containing peptide is useful for inducing apoptosis of a subpopulation. The present sequence is human fibronectin which contains then VLA-4 binding site used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 QAQQMVQPQSPVAVSQSKPGCYDNGKHYQINQQWERTYLGNVLVCTCYGGSRGFNCESKP 60

The present invention relates to a method for enhancing proliferation or inducing apoptosis of erythroid progenitor cells (EPCs). The method involves culturing haemacopoietic cellular populations containing EPCs in the presence of a polypeptide having an integrin very late antigen (VLA) 5 or VLA-4 binding site. The EPCs are useful for treating patients having induced, genetic or congenital erythroid disorders. Methods of the invention are useful in diagnostic assays of progenitor cells, e.g. cells occurring in pathologic states such as anaemia or polycythaemia and in the study of erythroid cell development. They are used in the screening of agents which inhibit or prevent apoptosis of erythroid cells. The present sequence is a human protein related to the modulation of EPCs. This sequence is used in the invention
                    Modulating proliferation of erythroid progenitor cells in a hematopoietic cellular population by culturing with polypeptides containing an integrin very late antigen 5 or 4 binding site, useful in treating erythroid
                                                                                                                                                                Disclosure, Page 55-64; 66pp; English.

E.coli. FN binds to fibrin, heparin and Staphylococcus aureus, and may be used to target a therapuetic agent onto natural fibrin eg. a blood clot. It may also be used in affinity purification of a polypeptide, conjugated to the collagen binding site of FN and immobilised on a collagen surface. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The amino acid sequence is that of human fibronectin, this can be used to derive polypeptides which are identical to part of the fibrin- binding domain (FBD) of fibronectin. These polypeptides can be used to inhibit thrombolysis formation; or (coupled to a thrombolytic agent) to induce thrombolysis, or to treat wounds, e.g. in shin, eyes or tendons (in conjunction with a polypeptide which includes a part of the cell-binding domain (CBD) of fibronectin). These polypeptides are easier to prepare than the full 31kD polypeptide. It can also be used to image fibrincontg. materials, esp. a thrombus or athero- sclerotic plaque, pref. using a gamma counter. (Updated on 25-WAR-2003 to correct PI field.)

The present invention describes the human Zmax1 gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, paget's disease, sclerostosis, osteomalacia and fibrous dysplasia.

ABA82038 to ABA82700 and AAG68158 to AAG68193 represent sequences used in the exemplification of the present invention

```
contractions genes (1) which are differentially regulated in prostate cancer. (1) Is useful for displaying a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample, where prostate cancer. (1) Is useful for assessing a therapoutic or preventive intervention in a subject having a prostate cancer, which involves context as a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. (1) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer. (2) is also useful for identifying agent under conditions effective for in prostate cancer cells, which involves contacting a polypeptide differentially-regulated in prostate cancer cells, which involves contacting a polypeptide differentially-regulated in the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (1) is useful a markers, as drug targets, and for detecting, preventing or treating, determining predisposition to diseases and conditions especially relating to prostate cancer. (1) and its expression conditions especially relating to prostate cancer. (1) and its expression conditions especially relating to prostate cancer. (1) and its expression conditions especially relating to prostate cancer. (1) and its expression conditions especially relating to prostate cancer. (1) and its expression conditions especially relating to prostate cancer. (1) and its expression conditions especially relating to prostate cancer. (1) and its expression conditions especially relating to prostate cancer. (1) and its expression conditions especially relating to prostate cancer. (2), to determine the type of development, the nature of genetic defect, etc. The polypeptide encoded by (1) can be used for expressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of specific genes, and groups of genes, expressed in pathways physiologically relevant to prostate cancer permits the definition of functional and disease pathways and the delineation of targets in these pathways which are useful in diagnostic, therapeutic, and clinical applications. This is the amino acid sequence of a protein differentially regulated in prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes genes (I) which are differentially regulated in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; Page 378-386; 416pp; English

```
The invention relates to novel transgenic animals expressing the high bone mass (HBW) gene, expressing the corresponding wild type HBW gene, comprising an alteration of the gene encoding LRP5 or LRP6, or expressing an LRP5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation. The transgenic animals are invention may have a use in gene therapy. The transgenic animals and the invention may have a use in gene therapy. The transgenic animals and concleic acids are for the study of bone density modulation, where the bone mass is modulated relative to non-transgenic animals of the same species in more than one parameter selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The transgenic animals, nucleic acids and methods are useful for identifying molecules involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, and consequence of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development,

Given in ABR92047 encode the human cervical cancer marker proteins (I) given in ABR92047 to ABR92164. A higher level of expression of (I) than normal indicates the presence of cervical cancer. Also described: (I) a coptaining (I); (2) a host cell (III) containing (I); and (3) assessing (MI) whether a patient is afflicted with cervical cancer, comprising comparing the level of expression of a marker in a patient's cample, and the normal level of expression of the marker in a control non-cervical cancer sample, where a significant increase in the level of expression of the marker in the patient's sample relative to that in the corror sample is an indication that the patient is afflicted with cervical cancer. (I) has cytostatic activity, and can be used in gene therapy and in vaccines. (I) is useful in detecting, characterising, preventing and treating human cervical cancers. (I) may also be used in various prognostic assays, pharmacogenomics and in

Mi involves providing a set of genes that are differentially expressed in cancerous or non-cancerous conditions, determining the expression levels of the set of genes and calculating a ratio of the expression levels of the differentially expressed genes. MI is useful for diagnosing the presence of cancer cells or non-cancer cells in a tissue sample, where the cancer is malignant pleural mesothelioma (MPW), lung adenocarcinoma, squamous carcinoma, medulloblastoma, prostate cancer, breast cancer, diffuse large B-cell lymphoma, follicular lymphoma and ovarian cancer, diffuse large B-cell lymphoma, follicular lymphoma and ovarian cancer, diffuse large B-cell lymphoma, follicular lymphoma and ovarian cancer, diffacentially expressed genes is used as an indicator of cancer type, cancer class, and/or cancer prognosis, and indicator of cancer type, cancer class, and/or cancer prognosis. The present sequence

The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence was used to illustrate the invention.

RESULT 15

```
The present invention relates to regulating LRP5, LRP6 or HBM activity in a subject comprising administering a composition which modulates a Dkk activity. The method is useful for modulating lipid levels and/or bone mass, and is useful in treating or diagnosing abnormal lipid levels and bone mass disorders, such as osteoporosis, bond fracture, age-related loss of bone, a chondrodystrophy, drug-induced bone disorder, high bone turnover, hypercalcaemia, hyperostosis, osteogenesis, imperfecta, osteomalacia, osteomylitis, Paget's disease, osteoarthritis, and rickets. Modulators of Dkk activity are useful for as reagents in studying bone mass and lipid level modulation, in modulating wnt signaling, or treating Dkk-mediated disorders. The present sequence represents a human protein sequence related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Regulating LRP5, LRP6 or HBM activity in a subject, useful for modulating lipid levels and/or bone mass, and for in treating bone mass disorders, e.g. osteoporosis, comprises administering a composition which modulates
                                                                                                                                                                                                                                                    LRP5; LRP6; HBM; Dkk activity; Osteopathic; Antiinflammatory; Antiarthritic; bone mass disorders; osteoporosis; hypercalcaemia; hyperostosis; osteogenesis; Wnt signaling.

The invention relates to a method of diagnosing the presence of cancer cells in a tissue sample, determining prognosis or outcome of a cancer patient, selecting a course of treatment for a subject having or suspected of having malignant pleural mesothelioma (MPM) and evaluating treatment of MPM comprising determining the ratio of the expression level of a set of genes differentially expressed in a cancer tissue. The cancer is chosen from MPM, ung adenocarcinoma, cancer tissue. The cancer is chosen from MPM, ung adenocarcinoma, cancer tissue. The method is useful lymphoma, follicular lymphoma and ovarian cancer. In method is useful for diagnosing MPM in a subject suspected of having MPM which involves obtaining a tissue sample suspected of being cancerous from a subject and determining the expression of nucleic acid markers or its expression products in the tissue sample. This sequence represents a thman MPM protein of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at sequata.uspto.gov/sequence.html.
                                                                                                                                                              Human; malignant pleural mesothelioma; MPM; tumour; lung adenocarcinoma; squamous carcinoma; medulloblastoma; prostate cancer; breast cancer; diffuse large B-cell lymphoma; follicular lymphoma; ovarian cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing the presence of cancer or non-cancer cells in tissue sample, useful for diagnosing malignant pleural mesothelioma comprises determining ratio of expression level of a set of genes expressed in cancer tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5 QAQQMVQPQSPVAVSQSKPGCYDNGKHYQINQQMERTYLGHVLVCTCYGGSRGFNCESKP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 QAQQMVQPQSPVAVSQSKPGCYDNGKHYQINQQWERTYLGNVLVCTCYGGSRGFNCESKP
